

ABSTRACT

A quick release holster assembly for carrying an object like a firearm is provided. The holster is preferably worn inside the trousers. A holding member for receiving a firearm is coupled to a planar member capable of actuating in a cantilever fashion. A pair of retaining members extend from the planar member towards the holding member. The holding member, the retaining members and the planar member form a closed loop, as the planar member is preferably preloaded such that at least one of the retaining members makes contact with the holding member. The retaining members extend in an essentially perpendicular fashion from the planar member, and include frictional members, like a rubber grommet for example, that allows the holster to “cling” to the user. TO put the holster, the user slides the holding member between his or her torso and the waistband of the trousers. The user then gently pulls the planar member away from the holding member, thereby separating the retaining members from the holding member, which allows a belt to slide between the retaining members and the holding member. The invention offers a quickly releasable, easily concealable holster.
